Experimental Thesis: “Simple Offer” Ad Creative will perform as well or better than “Animated Carousel” Ad Creative

Control: Carousel

Frame 1

Frame 2

Frame 3

Challenger: Simple

Summary:

- Despite being significantly harder to produce, “Animated Carousel” Ad Creative did not consistently driver higher engagement rates than “Simple Offer” static Ad Creative
- The presence of multiple SKUs in the “Animated Carousel” format did not drive incremental interactivity
 - Clicks on Final SKU after animation ends: 69.9%
 - Clicks on Intermediary SKU during animation: 8.4%
 - Only 3% of all clicks came from users who manually navigated to the Intermediary SKU
- Dominant determinant of user-engagement is *when* they noticed the ad
 - Time-distribution of clicks is the same for all size, all concepts
- The 300x600 size may warrant further testing, as inventory appears to benefit from combination of “forced attention” (e.g., an interstitial) and animation
 - While most sizes respond the same over time, 300x600 in this campaign and the 320x50 in the prior one are different. This provides an opportunity to think about approaching the audience using different creative-response strategies

Presence of “Animated Carousel” concept does not consistently affect engagement rates across all sizes (no statistical significance)

300x250  VS MIN +6.3% VS WINNING - CONFIDENCE - SCORE 374.4	Challenger A  VS MIN - VS WINNING -6.0% CONFIDENCE 59.9% SCORE 352.0
160x600  VS MIN +12.2% VS WINNING - CONFIDENCE - SCORE 653.8	Control  VS MIN - VS WINNING -10.9% CONFIDENCE 65.8% SCORE 582.7
728x90  VS MIN +4.3% VS WINNING - CONFIDENCE - SCORE 452.6	Challenger A  VS MIN - VS WINNING -4.2% CONFIDENCE 50.3% SCORE 433.8
300x600*  VS MIN +20.1% VS WINNING - CONFIDENCE - SCORE 1.4k	Challenger A  VS MIN - VS WINNING -16.7% CONFIDENCE 78.9% SCORE 1.2k

*300x600 Format may benefit from “forced attention” inventory

nex+rev

Timing does matter in terms of when a click occurs (but consistent across all sizes regardless of concept)

Only 3% of Clicks Came from “Consumer Initiated Navigation”

Confidential *Initial Frame: 12.8% Initial Load, 8.1% Delayed Load

For further study: Click pattern identical, except *early* bump on 300x600 (possibly result of more “interstitial-like” placement)

Appendix

Looking back at timing effects in D29B Special Order Cabinets

In D29B, many sizes followed the same timing pattern as D28O (leading to hypothesis for a default engagement pattern for THD consumers)

D28O Overall Pattern of Clicks by Time

D29B Pattern by Selected Sizes

However, the D29B Mobile (320x50) was very different. Reinforcing the idea that inventory type plays a big role in consumer response
